Software Engineer (Go · React / Next.js)

Ryan PINA-SILASSE

(581) 849-3368 | ryanpinas77@gmail.com | ryan-pina.dev | LinkedIn | GitHub

Drummondville, QC · Open to relocation: Toronto, ON

Software Engineer specializing in Go and React / Next.js, with 6 years of work experience building production web applications in both France and Canada.

Sole engineer and technical decision-maker on a legacy e-commerce migration.

I start from the business problem, validate every external contract before building, and measure the result.

Technical Skills

Languages:	Go, TypeScript
Backend:	chi (Go), REST APIs, PostgreSQL
Frontend:	React, Next.js, Astro, Expo, TanStack Query, Redux Toolkit, Tailwind CSS
DevOps & Cloud:	Docker, AWS, Terraform, GitLab CI/CD, GitHub Actions, Cloudflare, Render
Testing:	Vitest, Playwright (E2E), Lighthouse CI
Engineering:	Software Architecture, Technical Audits, API Design, Code Reviews
Spoken:	French (native), English (professional)

Professional Experience

Software Engineer Mar. 2026 – Present
Midbec | Home Appliance & HVAC Parts Distributor | Drummondville, QC, Canada (Hybrid)
Stack: Go (chi), PostgreSQL, React, Next.js, TypeScript, TanStack Query, Redux, Tailwind CSS, GitLab CI/CD, UnoPIM, PartSmart

- Sole Software Engineer owning the first major overhaul in 10 years of a legacy PHP 5.6 e-commerce platform (9M+ requests/month), migrating it to Go and Next.js from audit (15+ critical risks identified) and architecture to implementation. Strangler fig approach: domain by domain, no big-bang rewrite.
- Built the ERP-backed checkout and customer-specific B2B pricing: server-side order creation, province-aware taxes (GST/QST/HST), carrier selection and ERP-confirmed totals. Designed to fail closed (no invented amounts, order blocked on calculation errors) and covered by 70+ automated tests.
- Reverse-engineered third-party systems (ERP, parts lookup, PIM) through network inspection and API probing, validating each contract before migrating.
- Results: raised desktop Lighthouse Performance from 55 to 95 (lab) by migrating 100+ SCSS files to Tailwind v4 with no visual regressions, and cut parts-lookup API latency from 820ms to 6ms on cached calls with token caching in a native Go proxy.

Full-stack Engineer (Freelance) Jan. 2025 – Dec. 2025
Neat Barber | Barbershop | Paris, France (Remote)
Stack: Astro, TypeScript, WordPress GraphQL, Cloudinary, Playwright, Lighthouse CI

- Rebuilt a legacy jQuery site solo, end to end: audit → architecture → delivery, with a zero downtime migration.
- Designed a headless CMS architecture: WordPress GraphQL with typed queries, and Cloudinary for asset delivery.
- Added Playwright E2E tests and Lighthouse CI to the pipeline, enforcing performance budgets on every deploy.
- Results: 93% JS reduction (600KB → 40KB), Lighthouse 68 → 94 and +25% organic traffic, all measured with Lighthouse and analytics.

Frontend Developer Oct. 2022 – Oct. 2024
Konbini | Online Media Platform | Paris, France (Hybrid)
Stack: TypeScript, Next.js, GraphQL, WordPress, Tailwind CSS

- Rebuilt the homepage with SSR + GraphQL for real-time editorial updates and faster page loads.
- Built a Twitch live detection integration, so live streams surface on the site without manual intervention.
- Built a dynamic partner content injection system with fallback logic, eliminating manual intervention for content updates.
- Results: shipped production features under tight editorial deadlines on a platform with 500K+ monthly users.

Education

Bachelor's degree in Digital Solutions Design and Development (WES equivalency) 2021 – 2024
French name: Bachelor Développeur Web, « Concepteur Développeur de Solutions Digitales »
HETIC | Montreuil, France

Projects

Flip, Your Judo Companion App | Personal project 2026
Repository: github.com/N95Ryan/Flip

- Mobile app for judo practitioners: technique library and a training journal behind Stripe subscriptions. Go backend with JWT auth and HMAC-SHA256 webhook verification, Expo frontend. In production on Render with Neon PostgreSQL.
- Containerized the API into a 46 MB distroless, non-root image, with idempotent migrations so any empty database bootstraps its own schema.
- Deployed it on AWS and codified the stack in Terraform: 34 resources created and destroyed in one command, $0 idle cost. Security groups chained ALB → ECS → RDS, no NAT gateway, secrets generated by Terraform.

Interests

- Judo: 10+ years, regional medalist. The mat teaches you things a standup meeting never will.
